

# Kendrick

Your words. Your meaning. Your moment.

Kendrick helps people with aphasia turn a few spoken or typed words into a message they review and choose to speak.

WHO IS THIS FOR?

# First: what aphasia is.

After a stroke, some people experience aphasia: difficulty using or understanding language. Someone may be able to express a few keywords but struggle to form a sentence.

Aphasia is a language disorder. It is more specific than a general “speech impediment.” Abilities vary widely from person to person.

## OUR INTENDED FIRST USERS

### Adults with nonfluent aphasia

People who can contribute a few words—spoken or typed—and review a suggested message, independently or with support.

We are exploring support for that workflow. We are not claiming Kendrick fits every person with aphasia, stuttering, or pronunciation difficulty.

AN ORDINARY MOMENT · ILLUSTRATIVE

# At the café, Maya has the order in mind.

coffee

oat milk

no sugar

Fictional composite scenario—not a testimonial.

A few words are ready.  
A full sentence is harder.

WHY IT  
MATTERS

Aphasia is  
common after  
stroke.

*Our focus is  
narrower.*

---

~2M

people in the United  
States are living with  
aphasia.

These figures describe the condition's scale—not Kendrick's market size, and not the size of our first-user group. Our prototype is for people who can supply keywords and verify the resulting message.

---

~1 in 3

stroke survivors are  
affected by aphasia.

WHAT KENDRICK DOES

# Words in. A draft out.

## *Speech only after review.*

Speech input is optional in this prototype. We do not claim validated recognition of aphasic speech.

THE PERSON STAYS IN  
CONTROL

Kendrick may  
suggest.  
*It does not  
decide.*

---

### Edit the draft

Every suggested sentence stays fully editable before anything is spoken or shared.

---

### Reject and restart

The person can discard a draft, return to their words, or start over.

---

### Keep original words

Source fragments remain visible beside the suggestion when they differ.

---

### Clarify when unsure

Ambiguous inputs can trigger one question instead of a guessed sentence. This detector is imperfect—some ambiguous cases still slip through.

# Related tools. Different job.

## Wispr Flow

Spoken input → polished writing across apps.

Strong for dictation and drafting text. Overlap exists when speech becomes writing; the primary job is writing productivity.

## AAC apps

Build messages with symbols, grids, prediction, or AI assists.

Established communication systems (e.g. Spoken and many others) already help people compose and speak messages. Kendrick does not replace them.

## Kendrick

A few words → reviewed everyday message → optional speak.

A focused prototype for keyword-to-message review in conversation. Worth testing with this audience—not a claim that nobody else helps people communicate.

HOW  
WE  
BUILT  
IT

# Phone interface. Local models.

**Optional branch:** Whisper on the paired computer can transcribe a recording into editable words. Typed input is the reliable demo path today.

No hosted model API for suggestions. Local Wi-Fi pairing is required. This is an engineering prototype, not a clinical device.

# Working software. Honest limits.

## Recorded developer test

INPUT

me tired need sit down

DRAFT RETURNED

I am tired. I need to sit down.

Saved from an earlier local-model evaluation run. A development check—not clinical evidence, and not a claim about every Ollama session.

## Implemented now

- Typed fragment input
- Draft or clarification response
- Editable review
- Speak / copy / share / phrasebook
- Local Qwen + optional Whisper

## Not finished

- Symbol tiles
- Multiple sentence choices
- Highlighted AI additions
- Validated aphasic-speech recognition
- Clinician or user study evidence

WHAT WE  
TEST  
NEXT

# Does it preserve meaning?

## *Does it reduce effort?*

---

### Questions to answer

When someone supplies keywords, does the draft match their intended meaning? Do they need fewer struggles to participate in an everyday request? Do they feel in control of what is spoken?

No invented users, partners, hospitals, or success rates.

---

### How we answer them

Co-design and evaluate with people with aphasia and speech-language pathologists. Measure edits, rejected drafts, clarification usefulness, and perceived control—before any accuracy or outcome claims.

BACK AT THE COUNTER

# Your words. Your meaning. *Your moment.*

Maya reviews the draft—"A coffee with oat milk and no sugar, please."—and chooses to speak it. The message is hers.
